1. INTRODUCTION

The National Longitudinal Survey of Youth (NLSY) is a multipurpose survey of more than 12,600 individuals who have been interviewed annually since 1979, when they were 14 to 22 years of age. Sponsored by the Bureau of Labor Statistics of the U.S. Department of Labor, the NLSY has gathered comprehensive information about the employment, education, training, and family-related experiences of the respondents as they have moved from adolescence to adulthood. Pregnancy and post-natal histories, including information on the mother's health and prenatal care, gestation, birth weight, infant feeding practices, illnesses, and well-care during the first year following each birth have been gathered through the support of NICHD. Questions have been asked about current child care use and the retrospective child care arrangements used by the mothers in the sample during the first three years of their children's lives. The NLSY sample includes over-representation of black, Hispanic, and economically-disadvantaged white youths in order to permit statistically reliable analyses of these subgroups.

The 1986 round of the NLSY included a supplemental survey in which children of the female respondents were assessed; support for this effort was provided by NICHD and several private foundations. Using a wide range of measures, data were collected on the cognitive ability, temperament, motor and social development, behavior problems, and perceived competence of the children, as well on the quality of their home environments. The measures varied with the ages of the children, who ranged from newborn to age 12 at the time of the 1986 assessment. These child assessment instruments were administered in 1988, 1990, 1992, and (forthcoming) in 1994 to all age-eligible children of NLSY mothers interviewed in those years.

Beginning with the 1988 survey round, the NLSY included with its regular child data collection a special self-administered supplement to be completed by all children of at least 10 years of age who had been born to female respondents in the main sample. Administration of the self-administered supplement was repeated in 1990 and 1992, and plans are underway for an augmented data collection for these children in 1994. This report describes the variety of information available from this data set,

and provides basic descriptive material for an important population group - relatively high risk children who have been disproportionately born to younger American women. Readers should consult the 1993 NLSY Handbook for a more comprehensive description of the overall NLSY sample; detailed descriptions of the children who have been born to the NLSY women are presented in the NLSY Child Handbook (Revised Edition). Both documents are available at no cost from the NLS Public Users' Office at the Center for Human Resource Research.

2. THE SAMPLE OF MOTHER AND CHILDREN: STRENGTHS AND LIMITATIONS

Compared to a full national cross-section of American mothers and older children, this sample is significantly disadvantaged from both a social and economic perspective. The NLSY sample includes a national representation of women who were 14 to 21 years of age on January 1, 1979 and who were all between the ages of 25 and 33 years of age when interviewed in 1990. The child sample described in this report ranged in age from 10 to 19 in 1990, with the largest proportion (approximately 80 percent) being between the ages of 10 and 13 (Table 1). Thus, at the time these children were born, their mothers ranged in age from 11 to 23, with about 80 percent being between the ages of 16 and 20 (Table 2). Approximately one-third of the children have black or Hispanic mothers; fully 41 percent of the mothers had not completed high school as of the 1990 survey round (Table 3). Thus, a major strength of this sample is its utility for examining within and cross-generational determinants and consequences of maternal and family behaviors and characteristics for a largely disadvantaged sample of children. Readers should be aware that this sample should not be used at this time to form generalizations about a full cross-section of adolescents.

In order to adjust for the over-representation of minority children in the unweighted sample and for selective sample attrition between 1979 and 1990, all of the statistics, including those cited above, were weighted. This procedure makes the sample fully representative of children age 10 and over who had been born to a nationally represented sample of women who were 25 to 32 years of age on

January 1, 1990. Because one objective of this report is to provide users with information about the number of children age ten and above available for analysis as of 1990 we have included unweighted sample case estimates in Appendix One. We have also included preliminary cross-tabulations of selected 1990 and 1992 child behaviors and characteristics in order to suggest the utility of these data for longitudinal analysis, as well as to provide information about the number of children who completed the self-administered supplement in 1990 and 1992. The 1992 NLSY Child data will be available in 1994.

Sample Attributes

As may be seen from Table 2, the unweighted sample includes 1116 children who completed the self-administered supplement in 1990; 527 of these children are black, 226 are Hispanic and 363 are non-black, non-Hispanic. Almost all of the children in the sample were born to women between the ages of 15 and 22. About 90 percent (i.e., approximately 1000) of the child sample cases were between the ages of 10 and 14 (Table 1). Additionally, 376 of the 1116 were at least 13 years of age, and thus eligible to complete the confidential self-report items on sexual activity.

We estimate that 1295 children were eligible to complete the questions in the Child Self-Administered Supplement in 1990 (Table 4). That is, they were at least ten years of age and lived in their mother's residence. Thus, the overall questionnaire "completion rate" was about 86 percent, although, of course, completion rates for individual items varied. Completion rates were highest for black children (89.6%), somewhat lower for non-black non-Hispanics (84.6 percent), and lowest for Hispanic children (81.3%). Readers should note that we categorize children as "Black" or "White" in many of the tables included in this report; the "White" category includes both Hispanic and non-black, non-Hispanic children. There was no systematic evidence of variations in completion rates either by age of child, or age of mother at the birth of the child.

For the most part, the interview schedules were completed on paper by the children

themselves. Almost 90 percent (997 children) of the interview schedules were self-administered in this manner. Nearly all the rest (113) were completed by the interviewer, and six interviews were administered by telephone. Readers should be aware that approximately 800 children completed the 1988 Child Self-Administered Supplement, and that some of these children were no longer available for interviews in 1990 because the economically-disadvantaged white oversample of children was deleted from the sample prior to the 1990 survey round; therefore, any longitudinal analyses incorporating both the 1988 and 1990 survey data would be limited to a much more modest sample of approximately 600 children.

Questionnaire Content

As may be seen in Table 5, the Child Self-Administered Supplement (hereafter termed "child supplement") is wide ranging in content. Additionally, the variety of topics included was broadened considerably between the 1990 and 1992 data collections, and will become increasingly diverse with the 1994 survey round (which will include an extensive data collection for all of the eight to nine hundred children at least fifteen years of age by that date). The 1988 and 1990 self-administered supplements covered such topics as: parent-child joint activities; the extent to which the parent and child were involved, both separately and jointly, in decisions affecting the child; school satisfaction; and how the child spent his or her non-school hours, including jobs and religious involvement. There were also questions about friendship networking, dating and sexual initiation, expectations regarding the future in education, family and career domains, and substance utilization and involvement in other non-normative activities. Researchers who are considering using these data are encouraged to examine the 1990 Questionnaire, which is included as Appendix Two.

3. AN OVERVIEW OF THE CHILD DATA

With minor exceptions, the description of the 1990 data will follow the sequencing of questions in the 1990 child questionnaire. The tabulations present weighted statistics, typifying the family situations for children age ten and over who have been born to women who were 25 to 33 years of age when interviewed in 1990. The reader is reminded that the cross-tabulations included in this report are limited to the child responses in the child supplement. From an analytical perspective, the data available from the child supplement should be considered within the context of all available NLSY materials. That is, the child responses can be used both as outcomes as well as explanatory inputs when juxtaposed not only with the child assessments but also when considered within the context of the full history of 1979-1990 maternal and family information available. In this regard, the reader is encouraged to examine the 1993 edition of the NLS Handbook, the NLSY Child Handbook (Revised Edition), and relevant NLSY main and child interview instruments before undertaking research with this data set. While the tabulations included in this report may be of intrinsic interest on their own, their major value is to suggest the breadth of information available to help explain the child's cognitive or emotional status or to clarify behavior patterns of the child's mother or other family member. The reader also should be aware that the 1994 NLSY child data collection will include a comprehensive interview with all of the children age 15 and over -- a portion of the child sample which, for the most part, overlaps the one described in this report. This 1994 data collection will profile the later adolescent employment, training, education and family experiences of these youth. It will be possible, for example, to link the within-family attitudes and behaviors described here with subsequent "early adult" employment, educational and family experiences.

Family Interaction and Child Responsibilities Within the Home

The first set of tables in this report describes within-family interaction patterns. Table 6 focuses on the extent to which the child and at least one parent together and carried out an activity

outside of the house within the past month. The most typical joint activity was shopping to "get something" for the child, such as clothes, tapes, records or games. This was followed by going out to dinner together or going to church. Activities with potential intellectual content, such as going on an outing or going to a movie, were less prevalent. While the propensity to jointly carry out those activities varied by race or gender, the variations did not tend to be systematic.

Table 7 highlights parent-child interactions that took place within the home during the week preceding the interview. About half of all the children reported that they had "done things together, such as build or make things, cook or sew", or had worked on homework together with a parent during the past week. Slightly fewer reported having played a game or sport with a parent during that time. Girls were slightly more likely to "do things together" with a parent but, not surprisingly, boys were more likely to play a game or sport with a parent. There were no significant racial variations in this regard.

We shift now from the socially-interactive domain to that of chores, rules and decision-making regarding the child's activities both in and outside of the home. As may be seen in Table 8, the children are almost universally expected to keep their room straight and a large majority are involved in house-cleaning activities. About two-thirds participate in doing the dishes, and one third help with the cooking. With the exception of keeping one's room clean, there are greater expectations for girls' involvement than for boys. Traditional notions or expectations about girls being more involved in within-home tasks are thus still in evidence for this cohort of children. There also appears to be a somewhat more traditional expectation pattern evident in black households, at least with respect to the dishes and cooking tasks. This may reflect the fact that black children are much more likely to be in single parent households where there is a greater need for their assistance with house tasks.

Rules and Rule Decision-Making

Rules regarding keeping parents informed about where the child is and about doing homework are essentially ubiquitous; in contrast, somewhat lesser percentages of the children have family rules

about dating, parties, or watching T.V. (See Table 9). There are no apparent substantial racial variations in this regard and indeed, a gender distinction only exists with regard to dating or parties--where girls are more likely to face constraints than are boys. In this regard, it may be seen that the gender difference widens with age, reflecting the fact that girls (but not boys) are increasingly subject to constraints as they reach dating age.

Typically, between 40 and 50 percent of the children indicate that they have "some say" or "a lot of say" in making the rules, and little overall race or gender variation exists in this regard (Table 10). However, this overall uniformity masks some important age variations. As they age from 10 to 12 years old to 13 years and over, black children report a reduction in the input they have to rule decision making in several spheres, such as watching T.V., keeping parents informed about where they are, and doing homework. These patterns are not apparent for white children. Important distinctions between genders also emerge. Girls are given greater levels of responsibility regarding homework activities than are boys, while boys experience increasing involvement in making decisions regarding dating. This latter result parallels the finding in Table 9; girls are increasingly subject to dating rules, but only are only slightly more likely to be a part of the decision-making in this domain (at least in so far as they are willing to report on this issue).

Somewhat surprisingly, only small percentages, between 10 and 20 percent of children, indicate that they "often argue" with their parents about these rules (Table 11). Typically, the level of dissention declines with age, with the dating item for girls once again being a conspicuous exception. For girls only, the level of parent-child disagreement increases as we move from the 10 to 12 year olds to the 13 and over age category.

A minority of children indicate that their parents often discuss important decisions with them or "listen to their side of an argument", although there is modest evidence of greater consensus in black than in white families (Table 12). The suggestion is that more often than not, the children may not be heavily involved in important decisions which affect their life. Additionally, the older children are no more likely to be involved in decision making than are the younger ones. The results presented in

Table 12 also suggest that in a substantial proportion of cases there may not be consensus between the parents on the decision that is made. Overall, parents "always" agree with each other when dealing with the child in only 14 percent of households; parents "usually agree" in an additional 47 percent of households. We do not, however, know the extent to which levels of parental consensus might vary in relation to the seriousness of the issue under consideration.

Additional insights into the decision-making process may be gained from Tables 13 through 16, which identify who the primary family decision makers are with regard to a variety of issues of concern to the child. (Note that the percentages sum to totals greater than 100 percent, reflecting the fact that more than one individual is often involved in the decision-making process). The child has little say regarding how late he/she may stay out or how much his/her allowance is, has moderate input into decisions about religious training, and more substantial input into decisions about TV watching, clothes buying, who to have as friends, or how to spend his/her own money. In all instances, mothers are more likely to be the decision makers than are fathers. However, only in the areas of curfew, allowance, and religious training do the children indicate that maternal input, on average, exceeds child input (Table 13).

There are, for the most part, no substantial variations between black and white children (Table 13) or between boys and girls (Table 14) in the extent to which they (the children) say they contribute to the decision making process. Mothers' contributions to this process do not vary substantially by race or by gender. There are, however, significant racial variations in the balance between maternal and paternal contributions to decision making. Fathers in white families are much more likely to be involved than are black fathers, reflecting the much greater likelihood of their presence in the home.

We consider the extent to which the likelihood of a child's or mother's involvement in decision making was contingent on the presence or absence of a man, whether that be the mother's spouse or her partner in the household, in Tables 15 and 16. For the most part, the extent to which the mother or the child is involved in specific decisions varies only modestly between households in which a man is present and those in which a man is absent. Overall, children's contributions to decision making varies

little. The mother's role in decisions regarding curfews and friends increases slightly, as does her input into the size of the child's allowance. Mothers play a larger role in decisions about curfews and allowance in white father-absent households than in father-present households. Similarly, mothers in households in which a man is absent play a more significant role in decisions regarding money issues, curfews, and friendship patterns. There are no major differences for black or white children in their contribution to the decision making that are contingent on whether or not the man is present.

There are some gender-based distinctions of note between households in which a man is present and those in which a man is absent (Table 16). Girls' participation in decisions about clothes, spending their own money in general, and choosing their friends is reduced in father-absent households relative to that reported in households in which a man is present. There are no parallel differences in evidence for boys. Mothers are more likely to be involved in decisions about their daughters' friends, curfews, and allowances in households in which a man is not present than they are in father-present households. Mothers are also more likely to be involved in curfew and allowance decisions in households where boys are present and the fathers are absent than in father-present households.

Schooling Satisfaction

Most of the children in this sample are in elementary or junior high (middle) school, with only small proportions having attained the high school level. As may be seen in Table 17, about 38 percent are in the fifth grade or below, 46 percent are in grades six through eight, and only about 16 percent have attained the 9th grade. Thus, when we examine the children's level of satisfaction with their schooling in 1992, we are for the most part considering their early-schooling well-being. In Tables 19 through 21 we compare the children's 1990 schooling satisfaction with preliminary results from the 1992 survey round (by which time they will have, for the most part, progressed through two more grades, and will have moved from an elementary or middle school to a middle or high school environment). Thus, observed changes in school satisfaction may reflect not only changes in feelings about a given school,

but changes associated with enrollment in a new school.

We also compare children's responses with their mothers' responses to identical items taken from the 1979 main NLSY survey, at which time the mothers were mostly of high school age. Because the mothers were, on average, somewhat older than their children are now some care should be exercised in interpreting these cross-generational comparisons.

It may be seen in Table 18 that the children are, for the most part, satisfied with their school; 48 percent are "very satisfied", and an additional 38 percent are "somewhat satisfied". Only about 14 percent are dissatisfied with their current school. It may also be noted that there is little racial or gender distinction in this regard. For the most part, blacks and whites, and boys and girls, are at least somewhat satisfied with their school. As may be seen in Tables 19 and 20, which compare children's satisfaction levels for 1990 and 1992, there is reasonable stability in the responses over time. Those significant changes that have occurred tend to be more in a positive than negative direction; much larger percentages have altered their responses from dissatisfied to satisfied than vice versa. For example, only about 10 percent of the children who expressed great satisfaction with their schooling in 1990 were either somewhat or very dissatisfied in 1992. Conversely, of those who were very dissatisfied in 1990, over half were satisfied in 1992. Careful analyses may permit one to clarify the extent to which the transitions are linked with such factors as school transitions, geographic mobility or changes in home or other environmental circumstances. A cursory examination of Tables 19 and 20 suggests that there may indeed be some variation in changes in levels of satisfaction by race and gender. It appears that white children and girls may be less likely to alter their notions regarding schooling satisfaction. These are issues which can be researched with the data set given the detailed information on child cognition and emotional development available in conjunction with the full battery of maternal and family behavior and attribute information.

Table 21 describes levels of satisfaction with school for all children who were interviewed in 1990 and 1992. It may be seen that almost three quarters of the full sample were either very or somewhat satisfied with their school(s) across the two survey points. In contrast, only about 6 percent

were either somewhat or very dissatisfied at both survey points; about 9 percent changed from being satisfied to dissatisfied whereas about 11 percent changed from satisfied to dissatisfied.

The final tables in this section contrast the 1990 responses of the children with their mothers' responses to the identical questions taken from the 1979 survey. Table 22 indicates that the children are typically much more likely to be very satisfied with their school than were their mothers in 1979. These distinctions are particularly pronounced for white children and for girls. As may be seen in Table 23, most of this difference reflects the greater likelihood of the children's generation to provide a "very satisfied" response in situations where the mother had responded "somewhat satisfied". There is only limited evidence of movement between the satisfaction and dissatisfaction categories across generations.

It is suggested that part of the generational difference may reflect the older average age of the mothers at the time of the 1979 survey. Also, one must consider that the mothers were perhaps much more "selected out" in terms of their emotional and economic status at the time of the 1979 survey, as evidenced by the fact that they either were already (or were soon to become) young mothers, with all that this may have implied for their socio-economic and psychological well being. While the children's generation certainly does not fully typify a young adolescent cross-section, it is not an outlier population to the same extent as was their mothers' cohort; the largest proportions of these children are not yet parents themselves and indeed, on the basis of our analyses to date, may not become so for a number of years.

Table 24 describes the children's (1990) and their mothers' (1979) responses to a full range of questions referring to specific attributes of their school environment. This table reports the percent of children and mothers who felt that the various statements were "very true". The alternative categories were "somewhat true", "not too true" and "not at all true". About 60 percent of the children felt that their school work requires them to "think to the best of their ability", while close to half felt that it was easy to make friends at the school and that teachers were willing to help with personal problems. About 20 percent felt that "most of their classes were boring" and a third felt that "at this school, a person has the

freedom to learn what interests him or her". Very small percentages (between 5 and 10) felt that their school wasn't safe, that their teachers didn't know their subject well and that "you can get away with anything at this school". Overall, the children rated their schools fairly highly.

Black children were more likely on average to feel it was easy to make friends, that teachers were willing to help, and that a person has the freedom to learn what interests them, than did white children. They also were somewhat more likely to not feel safe at the school. For the most part, gender differences in responses were modest.

Mothers and their children generally had similar response patterns. There were, however, two generational differences of interest. Children were much more likely than their mothers to say that "teachers are willing to help with personal problems", while mothers were much more likely than children to have stated that "a person has the freedom to learn what interests him or her". Interestingly, there is no cross-generational difference in response to the school safety question; very small percentages in either generation reported feeling unsafe.

Non-School Activities and Time Utilization

After a typical school day the NLSY children who are 10 years old or older are most likely to go home, although large proportions may vary their pattern from day to day or even within a particular day. As may be seen in Table 25, about 85 percent indicate that they spend time between school and dinner time at home; about 46 percent often go to a friend's house (multiple responses are possible), and 28 percent often go to a relative's house. Small (less than ten) percentages indicate that they sometimes go to the playground, library, mall or to a job. Only four percent of these children indicate that they have after school or extended day care. Black children are slightly more likely than white children to go to the playground, library or mall, to go to a relative's house, or to be in a day care program. White children are somewhat more likely to visit a friend's house or to go to their own home. Gender distinctions tend to be trivial.

The most typical post-school activities are doing homework or watching T.V. (about 90 percent), doing chores around the house (74 percent), and "spending time with friends or doing things with siblings" (about 70 percent). About 40 percent "go to a lesson or activity", and a smaller percent sometimes "read a book or magazine not assigned at school". About one in four has a job. As may be seen in Table 26, racial variations in the patterns are limited, but boys and girls do tend to follow somewhat different post-school activity paths. Girls indicate that they are more likely to spend time reading, and are slightly more likely to do homework, while boys are more likely to have a job or go to a lesson or activity. (The reader should note that this "activity" category includes involvement in post-school sports activities.)

Because of potential linkages with school success or post-school careers, it is useful to focus specifically on the employment patterns of these youths. As may be seen in Table 27, about 40 percent of the children sometimes work for pay, with only modest racial or gender distinctions being apparent. Those children who work for pay work an average of 13.5 hours a week and earn an average of about 53 dollars per week. Their average wage is slightly below the minimum wage. This average of 13.5 hours of work per week masks a considerable variation in employment patterns; close to 30 percent work 3 or fewer hours a week, while 36 percent work eleven hours or more. While not reported in this table, large proportions of these children have casual jobs, such as baby sitting, lawn mowing and the like. About 57 percent work once a week or less. Black children work fewer hours, but report earning higher weekly wages than their white counterparts. They earn average hourly wages of about \$5.55, compared with about \$3.85 for white children.

Boys work an average of about 2 hours a week more than girls, and indicate that they earn an average of 23 dollars more. The average boy earns about \$4.45 an hour, compared with \$3.30 for the girls in the sample. This difference undoubtedly is partly associated with gender differences in the kinds of jobs these children have (e.g., girls are more likely to baby sit which may pay an average lower wage than that earned by boys who may be more likely to have jobs such as newspaper routes or outside yard work). The 1994 child data collection will include an extensive employment and education

history for all the children who have attained at least 15 years of age. It will then be possible to link the employment patterns reported here, not only with subsequent employment patterns, but also with academic "success" or "failure".

Religion and Religiosity

Almost 90 percent of the children report a religious affiliation (Table 28), although the quality of the specific denominational reports is uncertain. For example, only about 15 percent of the children report a Roman Catholic identification, substantially below the 28 percent for their mothers in 1979. Consistent with expectation, the single largest denominational category is Baptist, which accounts for fully one-third of the children. Other specific Protestant groups included much smaller percents and a substantial proportion of the children reported themselves as "Christian-non denominational" or "Other religion".

Over sixty percent of the children indicate that they attend services more often than monthly, and fully 40 percent indicate that they attend religious services weekly. The children typically attend with their parents, and 75 percent indicate that many of their friends also attend. In fact, of those who indicate that they ever attend services, about 65 percent indicate that some of their friends go to the same church they go to. Thus, church attendance may be an important mechanism for social networking for the children. One somewhat surprising finding is that for those children who ever attend, almost 70 percent indicate that they would go to services even if their parents did not go. While there are substantial differences between black and white children in their denominational attachment (black children are much more likely to be Baptists), there are no other substantial racial differences in any of the religiosity dimensions we have highlighted.

It is useful to compare maternal 1979 responses on religion and religiosity with their children's responses in 1990. (The reader should consider that the children are somewhat younger on average in 1990 than their mothers were in 1979.) It may be seen that the children are more likely to be coded

into a Christian non-denominational or "Other religion" category than are their mothers (Table 28). They are also more likely to report a Baptist affiliation. Conversely they are much less likely to report that they are Roman Catholic. Regardless of affiliation, the children are much more likely to report frequent church attendance than were their mothers in 1979.

As may be seen in Table 29, cross-generational comparisons are reasonably close for the Protestant denominations, but less so for Roman Catholicism. About 70 percent of mothers who were Baptist in 1979 have children who report they are Baptist in 1990. The figure for Lutherans is about 80 percent. For Methodists, the percent is 35 percent with an additional 20 percent or so having children reporting they are Baptists. About half of the children of Roman Catholic mothers report Roman Catholicism as their denomination, with an additional 20 percent saying they are Christian (non-denominational).

Of perhaps greater interest is the relatively strong cross-generational propensity to maintain religious observance (Table 30). Of the mothers who attended services weekly in 1979, 57 percent of their children attended weekly in 1990, and an additional 13 percent attended more often than monthly (totaling 70 percent in these two categories). If the mother attended less than weekly, but more than monthly, the two relevant figures are 48 and 17 respectively. Of the mothers who indicated that they attended only several times a year or less, 35 percent of their children indicated they attended at least weekly and 18 percent said they attended less than weekly, but more than monthly. Finally, approximately 42 percent of the children whose mothers said they had not attended at all say they attend more than monthly. These figures are consistent with a pattern of increased church attendance across generations for these cohorts of mothers and children. As may be seen in summary form in Table 28, the proportion of children attending services more than monthly in 1990 is about 64 percent, compared with only 46 percent for their mothers in 1979. The issue of whether this difference reflects a secular trend, the fact that the children in 1990 are somewhat younger than their mothers were in 1979, or more fundamental differences between the relative statuses of the two generations at comparable life cycle points will be resolvable as the children continue to age and more closely match the ages their

mothers were in 1979.

Non-Normative Behaviors

In this section, we explore the extent to which the children are willing to report about non-normative behaviors in which they may be engaged. This includes a number of problem behaviors ranging from disobeying parents on minor issues to stealing or physically hurting another individual. We also present summary statistics on early substance use by the children, including reports of cigarette, alcohol or marijuana or other illicit drug use.

Results reported in Table 31 indicate that about half the children have stayed out later than their parents said they should or lied to their parents about something important. There are no apparent differences between black and white children, or boys and girls, with regard to either of these fairly typical early adolescent behaviors. Almost 20 percent of the children said that they had "hurt someone badly enough to need bandages or a doctor" and about one in ten said that they had taken something from a store without paying for it.

About one-fourth of the children said that they had been required to bring parent(s) to school because of something they did. Approximately 8.6 percent said that they had skipped a day of school without permission, and 7.5 percent indicated that they had damaged school property on purpose. The biggest racial difference is in evidence with regard to the first of these items. About 40 percent of black children had to bring a parent to school, compared with 19 percent for white children. This item also showed the largest gender variability - 28 percent for boys compared with 20 percent for girls.

Children living in homes without a father or father figure present are more likely to break rules or engage in non-normative behaviors. There is a substantial difference in the likelihood of a parent having to go to school "because of something the child did", and lesser but significant differences in such behaviors as "staying out late", "taking something from a store" and "skipping a day of school" between father-present and father-absent children. These differences are much more substantial for

white than for black children. Gender differences which do appear suggest a greater deterioration in female than male behavior when the father is absent.

Substance Use

The 1990 Child supplement also included a sequence of questions probing into the child's early use of tobacco and other substances. While these items do not probe into the intensity of substance use, they do provide insights into the age at which a child initially used a substance, as well as whether or not the substance has been used within the past three months. A more extensive sequence about substance use is incorporated into the 1994 special supplement for children age 15 and over. When these data become available it will be possible to develop a time line of early use and more carefully consider linkages between age at initiation, current substance use, and a wide range of antecedent and intervening family and child attributes and behaviors.

About one in five of the children acknowledges ever having smoked a cigarette; approximately 33 percent of the children 13 and over admitting to having tried smoking (Table 32). There is little gender difference; however, white children are somewhat more likely to have smoked at an early age than are black children, a pattern that is consistent with evidence reported for their parents' generation as well as other recent adolescent smoking surveys.

About one third of those who acknowledge having smoked have done so in the past three months; this figure increases to 45 percent for those age 13 and over. One positive implication of these statistics is that a large proportion of the children who are "ever smokers" have not done so recently. Their smoking history may have been early, experimental, and perhaps terminated. However, girls are more likely than boys, and whites more likely than blacks, to have continued their smoking into the present.

A comparable percentage (22 percent) of the children admit to having drunk alcohol, "other than just a sip or two" (Table 33). For those who admit to ever drinking, about 45 percent indicate that

they have had a drink in the past three months. There are no apparent racial or gender differences in this reported behavior.

Not surprisingly, drinking is closely related to the age of the child. About 13 percent of the 10 to 12 year olds have drunk alcohol, compared with 39 percent of those age 13 and older. Additionally, of those who have ever drunk alcohol, 35 percent of the 10 to 12 year olds, and 52 percent of those 13 and older, have done so in the last three months.

Table 34 uses preliminary data from the 1992 survey round to suggest the degree to which initiation to alcohol use is sensitive to a child's age. This table describes alcohol use in 1992 for the sample of children who had not yet had a drink as of 1990. An examination of the "yes" percent for the total sample shows a steady increase in alcohol initiation associated with age. For example, the percent of ten year olds having their first drink between age 10 and 12 is 15.6; 33.2 percent for 12 year olds; 45.5 percent for 13 year olds; 55 percent for children who were 14 by age 16. Clearly, these mid-adolescent ages are ones at which large proportions of children have their initial extensive experiences with alcohol. Additionally, it appears that white children are much more likely to experiment with and to use alcohol at these ages than are black children.

Acknowledged marijuana use among this cohort of children is quite modest, as may be seen in Tables 35 and 36. Overall, only about 3 percent of the children admit to having used marijuana; this figure increases slightly, to 5 percent, for those age 13 and over. (The reader should note that because of modest sample sizes these figures should be interpreted with a certain amount of caution.) There is no apparent racial difference, but boys are slightly more likely to acknowledge use than are girls. Overall, for non-users, the likelihood of initiation into marijuana use is low until age 14. Between age 14 and (approximately) 16, about 17 percent became users for the first time. Between the ages 16 and 17, an estimate for initial use is 25 percent. Finally, Table 37 shows that only very small proportions (0.9 percent) admit to having used other illicit drugs. The low rate of recent (within the 3 months preceding the administration of the survey) incidence suggests that this use was largely experimental and not repeated.

Friendship Networks, Dating and Early Sexual Activity

Generally speaking, the children in this sample are involved in fairly extensive friendship networks which tend to be somewhat gender selective. It may be seen from Tables 38 and 39 that about 80 percent of the boys indicated they had three or more "close" friends who are boys, and that close to 60 percent of the boys indicated that they had three or more close friends who were girls. In contrast, only very small (less than 4) percentages of boys indicated that they had no close friends who were boys, but about 20 percent had no close friends who were girls. Not surprisingly, the proportion of boys having close girl friends increases from about 50 percent to 70 percent as one moves from the 10 to 12 year olds to the 13 and over age group. As may be noted from Table 40, boys typically "choose" friends in their own grade. When asked whether or not they "often felt lonely and wished they had more friends", most of the boys appeared fairly content: 62 percent "hardly ever" felt lonely, 27 percent "sometimes" felt lonely, and about 11 percent "often" felt lonely (Table 41). This factor is also age sensitive, as the proportion of boys feeling lonely declines with increasing age.

The patterns for girls were somewhat symmetrical, although there is evidence to support the notion that girls in this age range perhaps network even more extensively than boys, both within and across gender. Over 90 percent of girls indicate that they have at least three close girl friends, and virtually none indicate that they are friendless. Girls are also slightly more likely to have three or more boys who are close friends than was true for the boy mirror image. Older girls are somewhat more likely to choose friends from a higher grade than are their male counterparts, reflecting the tendency of girls to date boys older than themselves. However, it is fair to generalize that for the most part girls, just like boys, tend to choose most of their friends from their own grade level. There are no pronounced differences between the boys and girls with respect to "feeling lonely"; most girls "hardly ever" feel lonely or wish they had more friends. As with the boys, only about 11 percent "often" feel lonely.

It is possible, from an analytical perspective, to link the friendship items with all of the available information on child behavior problems, home environment and within-family interactions. It will also be

possible, with the availability of the 1992 data, to sort out those children who appear to feel more or less isolated for longer periods of time and to link this pattern with the full range of related child attributes and behaviors.

While the children appear to have fairly extensive social networks, only small percentages have begun dating. This reflects the fact that most of these children are still quite young as of 1990. As may be seen in Table 42, less than a quarter of the children have had a date, with the percentages being slightly higher for black than for white children and significantly higher for boys than for girls. The reported ages at first date for those who have dated are quite early, which is essentially an artifact of the youthfulness of the sample.

Of those children who have begun dating, about 37 percent date once or twice a week, and an additional 27 percent date once or twice a month. Not only are girls less likely to date, but if they indicate they have dated, they are more likely than the boys to have dated infrequently. There is, however, little gender (or racial) variation in the tendency to have multiple dating partners. About 55 percent of boys, girls, blacks and whites indicate that when they date, it is usually "the same person".

Sex Education and Sexual Activity

As may be seen in Table 42, only about nine percent of the children in the sample who were age 13 and over indicate that they have ever had sex as of 1990. There are no significant racial differences in this regard; however, boys are twice as likely as girls to have been sexually active. At this time the percentages are too modest for further tabular exploration, given that only about 150 children for each gender completed the item on sexual activity.

About half of all the children age ten and over have had sex education classes. A small percentage of them have had at least some school discussion regarding sex prior to the 5th grade. This issue is far more likely to have been covered in grades five and up.

About sixty percent of the children indicated that they have "talked to somebody in their family

about sex." Most typically this person was their mother and, far less frequently, their father. There is a tendency for children to be relatively more likely to talk with the same-sex parent. About 64 percent of girls have talked with their mother, but only nine percent have talked with their father; about 31 percent of boys have talked with their mother and 24 percent with their father. This gender distinction is not apparent for black children. Small percentages have talked with other relatives. Girls were more likely than boys, and blacks were more likely than whites, to have had a discussion about sex with a family member.

Expectations for the Future

While there is evidence that children's ideas about their future are inherently unstable, information on current expectations can nonetheless provide important insights into their state of mind as of the point in time that the information is provided. In this regard, their responses are undoubtedly closely linked with a full range of related ongoing activities in the home, in school, and with peers at the time. In a longitudinal context it is suggested that children's notions about their future educational and family-related plans, and that changes in these notions may be important inputs into explaining a variety of behaviors as well as being important outcomes in their own right. Their significance as outcomes rests not only on what they tell us about the child's current psyche, but also about what they may tell us about the likely future success or failure of the child in school, in the job market, and as a partner in a relationship. We will have repeated expectation measures over a series of years for many of these children; these measures will help clarify linkages between basic values regarding family and career and maturational status.

Table 43 synthesizes the children's responses to a series of expectation questions which were asked in 1990. Overall, over 60 percent indicated that they expect to receive at least a college degree, with fully 99 percent expecting to at least complete high school. These statistics should be considered within a contemporary context in which, at present, it is estimated that about 87 percent of young adults

in the U.S. complete high school and about 25 percent graduate from college. Given that this cohort of children does not typify a cross-section of young adolescents, but rather includes a disproportionate number of children from disadvantaged backgrounds, it is likely that their educational horizons are, on average, overly optimistic.

Their personal notions about "best" ages to get married are somewhat younger than for the U.S. population as a whole. Both boys and girls feel that 22 is about the best (median) age to get married; this figures should be compared with the current actual median ages for American men and women of 26 and 24 respectively. On the other hand, these children report a best age to have a first child of about age 24, which is not substantially different from the median age at first birth for all births to women in the United States in 1990.

Educational Expectations

Given the importance of education as a predictor of life-long career success, it is useful to consider the potential utility of the educational expectation measure. Table 44 compares the children's responses to the educational expectation item in 1990 and 1992. As the children approach a later point in their educational pathway we find a modest shift towards lesser expectations; the percent expecting a college degree declines slightly and the percent expecting lesser levels of education increases modestly. The modest net changes mask rather substantial changes in expectations at the individual level. For example, the 7 percent "net" decline in the percent expecting to receive a college diploma disguises the fact that 17 percent of all the children moved into that category between 1990 and 1992 whereas about 24 percent moved out (Table 44). Large "gross" flows may also be seen for all the educational levels except for the high school dropout category which loses and gains very few children. Indeed, only about 39 percent of all these children did not change their responses at all between 1990 and 1992. The interested reader may observe the actual patterning of transitions across educational categories in greater detail in Table 45.

Table 46 summarizes maternal responses about their expectations for their children in 1990 and 1992. Similar patterns of change may be noted, although the children themselves apparently have greater personal expectations than their mothers have for them. In 1990 about 64 percent of the children expected to receive a college degree, but only 40 percent of the mothers expected them to receive a degree. (The mothers responses are drawn from the 1990 NLSY Mother Supplement.) Thus, while both children and parents may be overly optimistic, the parents' perceptions may be slightly more realistic. However, at least for the 1990-1992 period, there is little evidence of a narrowing of the child expectation gap. As may be seen in Table 47, with the exception of some narrowing for the 13-15 years of schooling category, it appears that mothers and children seem to be as far apart in 1992 as in 1990 regarding how much schooling they expect the child to complete, even though the average child has moved two additional years along the educational ladder.

Evidence of the substantial lack of congruence between mothers and children in 1990 may be seen in Table 48. While the categories are somewhat subjective, it is suggested that only about half of the mother-child dyads have equivalent educational expectations for the child. About a third of the children have educational expectations exceeding those their mothers have for them, whereas less than half that number of children have lower expectations than do their mothers. Prospectively, the NLSY child data will be very useful for clarifying which children obtain their expectations, which children exceed expectations, and which fall short. In this regard, it will be possible to pinpoint which family, maternal and child attributes are associated with a better ultimate congruence between expectations and reality. For the moment, the available data can clarify the family and personal attributes associated with poorer and better child-mother congruence in responses. Of particular importance is whether or not congruence at high or low levels is associated with known intellectual and socio-emotional attributes of the child.

Indeterminate	3.7

APPENDIX ONE:
SAMPLE SIZES AND ITEM COMPLETION RATES

Child Supplement Sample Sizes and Item Completion Rates

Appendix Table 1 provides a breakdown of the number of sample cases available for analysis in 1990; the sample is described in terms of race, gender, and father present/absent categories. The potential user can apply distributions based on this table to obtain an estimate of the number of cases available in any particular text table. It may be seen that in most instances separate race, gender, or race-gender analyses are feasible. In addition, separate age and age-race analyses may be possible, although these sample sizes can become quite modest if one also stratifies by gender. It may also be seen that reasonably large samples are possible when one stratifies by father presence or absence and by race; however, stratification by race and age leads to some rather small cells. Of course, appropriate multivariate analyses can reduce the significance of some of the sample size considerations. Appendix Table 2 provides describes sample sizes available for 1990-1992 cross-year analyses.

Appendix Table 3 provides completion rates for all of the items in the Child Self-Administered Supplement. It may be seen that with only modest exceptions, completion rates were well over 90 percent. That is, over 90 percent of the children age 10 and over who were eligible (i.e., children living in the mother's home who satisfied "branching" conditions within the questionnaire) completed the various items.

Appendix Table 1. Adolescent Sample Sizes by Race, Gender, and Father Presence/Absence and Age.

White	82	87	132	37
Total	191	179	198	172

Note: Table adds to 1,111 rather than 1,116 cases because father presence/absence information is not available for five children.

Appendix Table 2. 1990-1992 Cross-Year Analysis Sample Sizes

<u>All Children</u>	<u>Boys</u>	<u>Girls</u>	<u>Father/Mother's Spouse Present in 1990</u>	<u>Father/Mother's Spouse Not Present in 1990</u>
Black	206	194	158	242
White	225	234	381	78
Total	431	428	539	320
<u>10 to 12 Years Old</u>				
Black	130	126	106	150
White	174	171	287	58
Total	304	297	393	208
<u>13 Years Old and Older</u>				
Black	76	68	52	92
White	51	63	94	20
Total	127	131	146	112

Note: Cases included in the sample described in this table were required to have valid values on age, race, and gender variables, as well as on all of the inputs used in the construction of the father present/absent variable.

Appendix Table 3. Item Completion Rates.

	<u>Self</u>	<u>Interviewer</u>	<u>Total</u>
1. Within the last month, have you and your parent(s):			
a. Gone to the movies together?	962 (96.9%)	109 (97.3%)	1077 (96.9%)
b. Gone out to dinner?	966 (97.3%)	111 (99.1%)	1083 (97.5%)
c. Gone shopping to get something for you - such as clothes, books, records or games?	975 (98.2%)	111 (99.1%)	1092 (98.3%)

c. Doing your homework?	951 (95.8%)	107 (95.5%)	1064 (95.8%)
d. Dating and going to parties with boys and girls?	950 (95.7%)	100 (89.3%)	1056 (95.1%)
7. How often does your mother or father:			
a. Talk over important decisions with you?	975 (98.2%)	111 (99.1%)	1092 (98.3%)
b. Listen to your side of an argument?	977 (98.4%)	110 (98.2%)	1093 (98.4%)
8. Who usually makes the decisions about:			
a. Buying your clothes?	967 (97.4%)	110 (98.2%)	1083 (97.5%)
b. How to spend your money?	961 (96.8%)	110 (98.2%)	1077 (96.9%)
c. Which friends to go out with?	953 (96.0%)	111 (99.1%)	1070 (96.3%)
d. How late you can stay out?	953 (96.0%)	108 (96.4%)	1067 (96.0%)
e. How much allowance you get?	916 (92.3%)	105 (93.8%)	1027 (92.4%)
f. How much TV you can watch?	954 (96.1%)	111 (99.1%)	1071 (96.4%)
g. Your religious training?	929 (93.6%)	109 (97.3%)	1044 (94.0%)
9. In dealing with you, how often do your mother and your father agree with each other?	958 (96.5%)	111 (98.2%)	1074 (96.7%)
10. What grade are you attending?	959 (96.6%)	110 (98.2%)	1075 (96.8%)

	<u>Self</u>	<u>Interviewer</u>	<u>Total</u>
11. There are many things people might say to describe their schools. Here are some things that other people have said about their schools. We would like to know how well you think these statements describe your school.			
a. It's easy to make friends at this school.	972 (97.9%)	110 (98.2%)	1088 (97.9%)
b. Most of the teachers are willing to help with personal problems.	967 (97.4%)	110 (98.2%)	1083 (97.5%)
c. Most of my classes are boring.	964 (97.1%)	109 (97.3%)	1079 (97.1%)
d. I don't feel safe at this school.	963 (97.0%)	110 (98.2%)	1079 (97.1%)
e. Most of my teachers don't know their subjects well.	968 (97.5%)	110 (98.2%)	1084 (97.6%)
f. You can get away with almost anything at this school.	964 (97.1%)	109 (97.3%)	1079 (97.1%)
g. My schoolwork requires me to think to the best of my abilities.	964 (97.1%)	109 (97.3%)	1079 (97.1%)
h. At this school, a person has the freedom to learn what interests him or her.	970 (97.7%)	110 (98.2%)	1086 (97.8%)
12. How satisfied are you with your school?	959 (96.6%)	110 (98.2%)	1075 (96.8%)
13. On a usual day after school, what do you do between the time school lets out and dinner time? Do you:			
a. Spend time with friends?	961 (96.8%)	108 (96.4%)	1075 (96.8%)
b. Read a book or magazine not assigned at school?	954 (96.1%)	107 (95.5%)	1067 (96.0%)
c. Do any chores around the house?	954 (96.1%)	109 (97.3%)	1069 (96.2%)
d. Work for pay?	947 (95.4%)	107 (95.5%)	1060 (95.4%)
e. Do homework?	961 (96.8%)	109 (97.3%)	1076 (96.9%)
f. Go to a lesson or activity such as sports or a club?	951 (95.8%)	105 (93.8%)	1062 (95.6%)
g. Watch TV?	959 (96.6%)	109 (97.3%)	1074 (96.7%)
h. Go to a shopping mall?	937 (94.4%)	106 (94.6%)	1049 (94.4%)
i. Do things with your brother(s) or sister(s)?	902 (90.8%)	97 (86.6%)	1002 (90.2%)
14. After a usual school day, where do you go between the time school lets out and dinner time?	965 (97.2%)	110 (98.2%)	1081 (97.3%)

	<u>Self</u>	<u>Interviewer</u>	<u>Total</u>
15. If you go home after school lets out, is an adult usually present when you get there?	962 (96.9%)	109 (97.3%)	1076 (96.9%)
16. How far do you think you will go in school?	901 (90.7%)	110 (98.2%)	1017 (91.5%)
17. Do you belong to any clubs, teams, or school activities, either in or out of school?	976 (98.3%)	111 (99.1%)	1093 (98.4%)
18. Think for a moment about a typical weekday for your family. How much time would you say you spend watching television on a typical weekday?	870 (87.6%)	105 (93.8%)	981 (88.3%)
19. Now think about a typical weekend day. How much time would you say you spend watching television on a typical weekend day?	888 (89.4%)	109 (97.3%)	1003 (90.3%)
20. Not counting jobs around the house, do you sometimes work for pay such as babysitting, paper route, or yard work for neighbors?	847 (85.3%)	109 (97.3%)	961 (86.5%)
21. If you do any work for pay outside your own home, what do you do? What are your duties?	345 (89.8%)	21 (91.3%)	368 (89.8%)
22. When you do these kinds of jobs, how often do you usually work?	349 (90.9%)	20 (87.0%)	371 (90.5%)
23. In the last three (3) months, how many hours have you worked in a usual week?	330 (85.9%)	18 (78.3%)	350 (85.4%)
24. How much money do you usually make in a week?	330 (85.9%)	19 (82.6%)	351 (85.6%)

25. In the last year, how many times have you:

- a. Stayed out later than your parent(s) said you should?
- b. Hurt someone badly enough to need bandages or a doctor?
- c. Lied to your parent(s) about something important?
- d. Taken something from a store without paying for it?
- e. Damaged school property on purpose?
- f. Gotten drunk?
- g. Had to bring your parent(s) to school because of something you did wrong?
- i. Skipped a day of school without permission?
- j. Stayed out at least one night without permission?

26. What is your present religion, if any?

27. In the past year, about how often have you attended religious services?

28. If you attend religious services:

- a. Do you usually go with your parent(s)?
- b. Would you go even if your parent(s) didn't?
- c. Do many of your friends go to religious services?
- d. Do some of your friends go to the same church or synagogue as you do?

29. How many close friends do you have who are boys?

30. How many close friends do you have who are girls?

1. Within the last ~~month~~, have you and your parent(s):
(ANSWER EACH ITEM.)

	<u>YES</u>	<u>NO</u>	
a. Gone to the movies together?	1	0	13-14/
b. Gone out to dinner?	1	0	15-16/
c. Gone shopping to get something for you - such as clothes, books, records, or games?	1	0	17-18/
d. Gone on an outing together, like to a museum or sporting event?	1	0	19-20/
e. Gone to church or religious services together?	1	0	21-22/

2. Within the last ~~week~~, have you and your parent(s):
(ANSWER EACH ITEM.)

	<u>YES</u>	<u>NO</u>	
a. Done things together, such as build or make things, cook, or sew?	1	0	23-24/
b. Worked on schoolwork together?	1	0	25-26/
c. Played a game or sport?	1	0	27-28/

3. In your home, are you regularly expected to help out with:
(ANSWER EACH ITEM.)

	<u>YES</u>	<u>NO</u>	
a. Straightening your room?	1	0	29-30/
b. Keeping the rest of the house clean?	1	0	31-32/
c. Doing the dishes?	1	0	33-34/
d. Cooking?	1	0	35-36/

4. In your home, are there any rules about:
(ANSWER EACH ITEM.)

	<u>YES</u>	<u>NO</u>	
a. Watching television?	1	0	37-38/
b. Keeping your parent(s) informed about where you are?	1	0	39-40/
c. Doing your homework?	1	0	41-42/
d. Dating and going to parties with boys and girls?	1	0	43-44/

IF YOU ANSWERED "NO" TO EVERY ITEM IN Q.4, SKIP TO Q.7 ON PAGE 5.

5. How much say do you have in making up the rules about...
(ANSWER EACH ITEM.)

	NO SAY AT ALL	A LITTLE SAY	SOME SAY	A LOT OF SAY	
a. watching television?	1	2	3	4	45-46/
b. keeping your parent(s) informed about where you are?	1	2	3	4	47-48/
c. doing your homework?	1	2	3	4	49-50/
d. dating and going to parties with boys and girls?	1	2	3	4	51-52/

6. How often do you argue with your parent(s) about the rules about...
(ANSWER EACH ITEM.)

	HARDLY EVER	SOMETIMES	OFTEN	
a. watching television?	1	2	3	53-54/
b. keeping your parent(s) informed about where you are?	1	2	3	55-56/
c. doing your homework?	1	2	3	57-58/
d. dating and going to parties with boys and girls?	1	2	3	59-60/

7. How often does your mother or father...
(ANSWER EACH ITEM.)

	OFTEN	SOMETIMES	HARDLY EVER	
a. talk over important decisions with you?	1	2	3	61-62/
b. listen to your side of an argument?	1	2	3	63-64/

8. Who usually makes the decisions about...
(CIRCLE ALL THE ANSWERS THAT APPLY.)

	YOU	MOTHER	FATHER	SOMEONE ELSE (tell who that is)	
a. buying your clothes? BEGIN DECK 64	1 65-66/	2 67-68/	3 69-70/	4 _____	71-72/
b. how to spend your money?	1 11-12/	2 13-14/	3 15-16/	4 _____	17-18/
c. which friend to go out with?	1 19-20/	2 21-22/	3 13-14/	4 _____	25-26/
d. how late you can stay out?	1 27-28/	2 29-30/	3 31-32/	4 _____	33-34/
e. how much allowance you get?	1 35-36/	2 37-38/	3 39-40/	4 _____	41-42/
f. how much TV you can watch?	1 43-44/	2 45-46/	3 47-48/	4 _____	49-50/
g. your religious training?	1 51-52/	2 53-54/	3 55-56/	4 _____	57-58/

9. In dealing with you, how often do your mother and your father agree with each other?

(CIRCLE ONLY ONE)

Always agree.....1

Usually agree.....2

Sometimes agree.....3

Never agree.....4

I only have contact with one parent.....5

59-60/

10. What grade in school are you attending? (IF SCHOOL HASN'T STARTED YET, PLEASE WRITE IN THE GRADE YOU LAST ATTENDED. IF YOU GO TO AN UNGRADED SCHOOL OR JUST TAKE CLASSES, WRITE IN THE GRADE YOU WOULD BE IN IF YOU WERE IN REGULAR SCHOOL.)

GRADE	

61-62/

Do not attend school or take classes at all.....00

IF YOU DO NOT ATTEND SCHOOL OR TAKE CLASSES AT ALL, SKIP TO Q.16 ON PAGE 8.

11. There are many things that people might say to describe their schools. Here are some things that other people have said about their schools. We would like to know how well you think these statements describe your school.

For each sentence below, circle whether you think it is very true, somewhat true, not too true, or not at all true for your school.
(ANSWER EACH ITEM.)

	VERY TRUE	SOMEWHAT TRUE	NOT TOO TRUE	NOT AT ALL TRUE	
a. It's easy to make friends at this school.	1	2	3	4	63-64/
b. Most of the teachers are willing to help with personal problems.	1	2	3	4	65-66/
c. Most of my classes are boring.	1	2	3	4	67-68/
